Research Interests

Machine Learning Systems, Efficient and Trustworthy Large Language Models, and Cloud Computing. I build systems that make machine learning faster, cheaper, and more trustworthy across the full stack, from storage and serverless runtimes through distributed and federated training to large-model inference. My group's current work has two lines: efficient reasoning, where we store, reuse, and prune the intermediate computation that models would otherwise discard, cutting the cost and latency of inference at matched accuracy; and alignment under multiple human values and risk, where we give practitioners principled control over what a model optimizes and how it behaves in the worst case.
